Voltage Isolator

Centre and screen Isolators are essential for systems where high voltage potentials are created. Line power installations typically have these problems, causing hum modulation. Long coax runs are susceptible to induced high voltages.

Modern head ends with micro-processor circuitry are more vulnerable to damage to voltage surges. The cost of an isolator is small in comparison to the possible saving by protecting valuable equipment from voltage spikes.

Centre conductor Isolators are typically used for blocking line power voltage, LNB power etc.
